

VERSION WITH MARKINGS TO SHOW CHANGES MADE,
AMENDED SPECIFICATION:

Please amend the paragraph appearing at Page 12, lines 2-10,
as follows:

The linking members 80 are preferably chains 82 having a hook 92 at each end to engage the eye-screws 40 of the upper and lower link connection structures 50 and 70. A telescoping tube and bolt tensioning mechanism 84 of known construction is provided within the chain, preferably at the middle of the chain, and has a tensioning lever 86 to rotate around the vertical chain to draw it into high tension. This tensioning is necessary so that the beam 14 and roof 12 do not bow upwardly before loading is transferred to the module floor 16.
